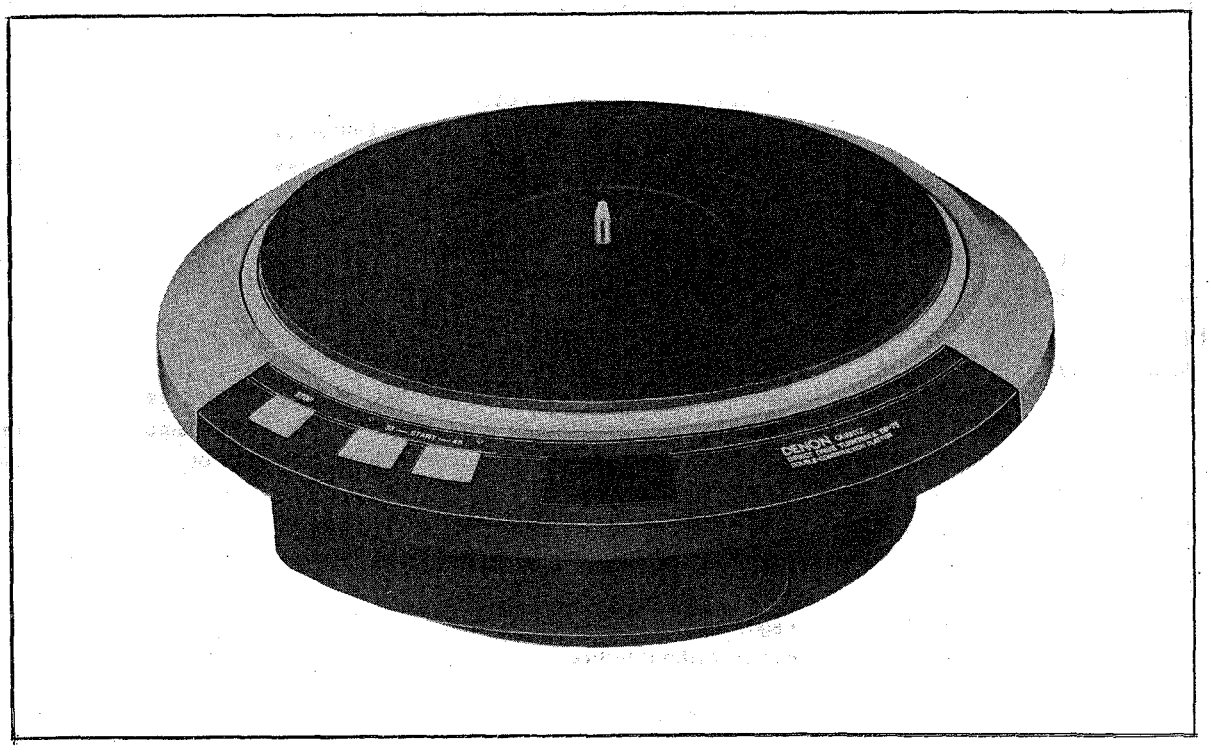
DENON

Hi Fi Component

SERVICE MANUAL

SERVO-CONTROLLED DIRECT DRIVE TURNTABLE

MODEL DP-75



Model DP-75

NIPPON COLUMBIA CO., LTD.

TABLE OF CONTENTS

SPECIFICATIONS

PHONO MOTOR

Drive system:	Direct drive by AC servo motor
Speeds:	33-1/3 rpm and 45 rpm
Wow/flutter:	Less than 0.015% Wrms*
S/N ratio:	More than 80 dB (DIN-B)
Starting time:	Less than 1.6 sec. to reach 33-1/3 rpm.
Turntable platter:	Casted aluminum alloy, 308 mm diam. Weight: 3.1 kg Moment of inertia: 370 kg-cm^2 (including turntable mat)
Motor:	AC out-rotor type servo motor
Speed control system:	Speed servo control by frequency detection system combined with phase control system with reference to the quartz crystal oscillator, (Speed servo control only at variable speed mode)
Load influence:	0% (At out-most groove with stylus force of 150g)
Brake system:	Electronic brake
Speed deviation:	Less than 0.002%

GENERAL

Power supply:	AC 50Hz/60Hz Voltage is indicated on the rating label. Multiple voltages are indicated if the equipment is provided with the user operated voltage selector. If single voltage is indicated, the equipment has only fixed voltage or the voltage selector is blinded by the shield plate.
Power consumption:	9W (At out-most groove with stylus force of 2.5g)
Dimensions:	376 diam. x 140(H)(mm)
Weight:	9.3Kg

* Measured by DENON's method using magnetic pulse wheel.

** Above specifications are subject to alteration without notice.

SAFETY PRECAUTIONS

Replace always with correct parts having correct rating, shape and material, etc. Especially the component with shading and/or ⚠ mark must be replaced only by the specified component for safety reasons.

NOTE

The Model DP-75 can be divided into two groups, the multiple voltage version with voltage selector, and the fixed voltage version with exclusive transformer.

THEORY OF OPERATION

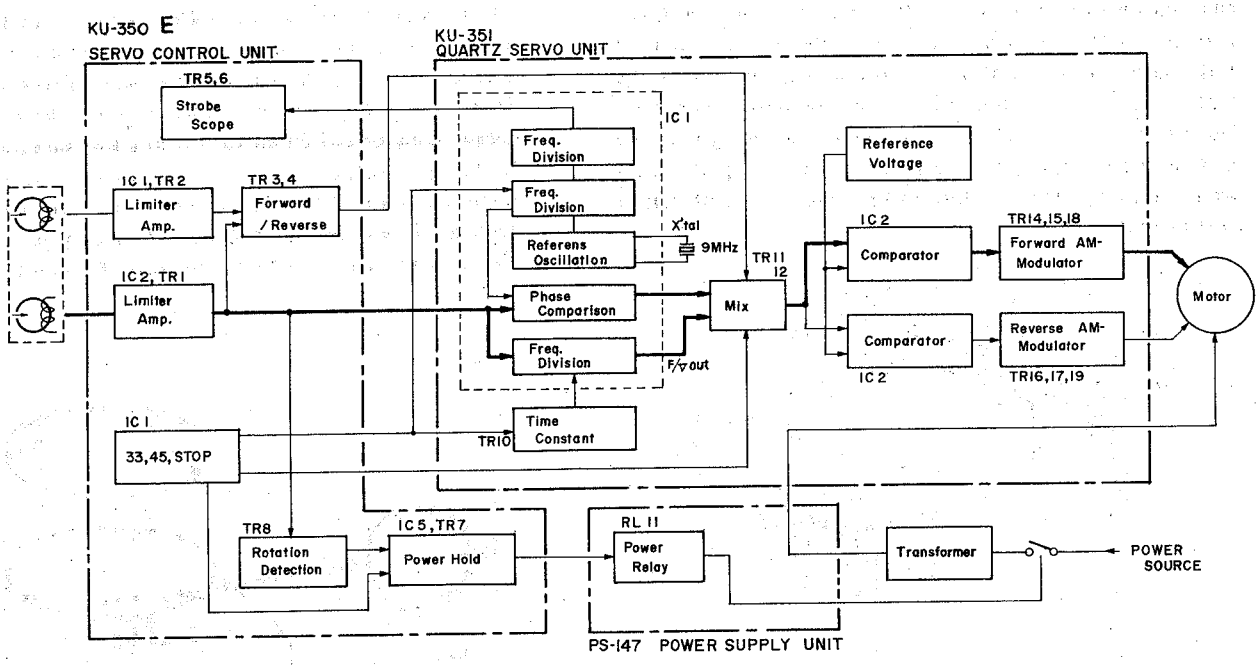


Fig. 1 Block Diagram of DP-75

Block diagram of the phono motor servo circuit is shown in Fig. 1.

The speed detection magnetic head encapsulates two sets of detection windings with a phase difference of 90 degrees. This head detects direction of platter rotation as well as its speed.

The output waveform detected by the magnetic head is shaped into rectangular waves by the limiter circuits (IC 2 and IC 3 on KU-350). The phase difference of these rectangular waves gives signal if the direction of platter is forward or reverse.

At the same time, the output frequency (555.5Hz at 33 rpm, 750Hz at 45 rpm) of one of the limiter circuit (IC 2, TR 1 on KU-350) is fed to the servo control IC (IC 1 on KU-351).

On one branch inside the IC 1 (on KU-351), the frequency signal is converted into a voltage inversely proportional to the speed (frequency) by the F/V converter.

On the other branch, the input frequency is divided therein to the same frequency as the reference frequency (138.9 Hz at 33 rpm, 187.5Hz at 45 rpm) which is also divided from the 9MHz quartz crystal oscillator so that the phase relation can be compared. The phase difference appears at the output in terms of voltage difference.

The output voltages of the F/V converter and the phase comparator are mixed and then compared with a reference voltage to modulate the amplitude of the motor drive circuits of either forward or reverse direction.

The change-over of the speed is performed by changing the dividing denominator of the reference frequency and simultaneously changing the proportion of the F/V converter.

The strobe scope is flashed by 1/2 the frequency of that of the comparison reference.

The limiter output (IC 2, TR 1 on KU-350) further detects if the platter is rotating or not, feeding the signal into the rotation detection circuit (TR 8, IC 5 on KU-350). Combined with this rotation detection circuit, when the start button, 33 or 45 is pressed, the power memory circuit (IC 5 flip-flop, TR 7 on KU-350) holds the power relay RL 11 on PS-147) until the rotation becomes almost still after the stop button is pressed.

SERVICE HINTS

1. When the magnetic head is serviced:

Make sure that the terminal connection is as shown in the Fig. 2. Otherwise, the platter may turn reversely.
Adjust the space between the magnetic head and magnetically coated surface of the platter to 0.2mm by inserting a piece of paper and secure it. Take note that variation of this space causes variation of stopping condition of the platter, or the decay time of the rotation detection circuit. Normal condition while the turntable mat being removed is that there remains a slight forward glinding of platter when stopping. Never allow reverse movement of platter when stopping.

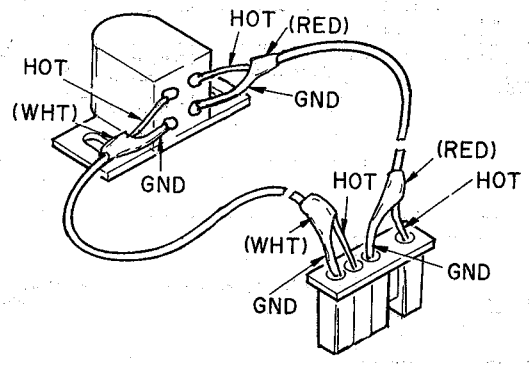

Fig.2 Head connection

2. Confirming regulator voltage:

An IC is employed for regulation voltage, allowing no fine adjustment. Confirm this voltage is 5V.

3. Adjustment of speed (KU-351)

(1) Connect a dual trace oscilloscope to TP-1 on KU-351 P. W. board.

(2) Start 45 rpm rotation first.
Adjust VR 2 so that the sampling pulse comes at 60% position from starting edge of the saw tooth waveform. (See Fig. 3.)

(3) Change over to 33 rpm and adjust VR 1 to bring the pulse to 60% position in the same manner.

NOTE

If a single trace oscilloscope is used for adjustment, connect the ground terminal of the oscilloscope to the sampling waveform output of TP-1 instead of connecting to ground terminal thereof. Duplexed waveform can be observed.

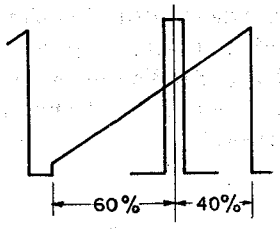

Fig.3 Speed adjustment

CAUTION!
(Models with the voltage selector)

This equipment has been preset for a line voltage of 220V. Before inserting the power plug, please check if this voltage corresponds with the line voltage in your area. If it does not, be sure to adjust the voltage selector switch to the proper setting before operating this equipment. The voltage selector switch is located on the base surface below the turntable platter. Simply insert a screw driver into the voltage selector switch and turn it in either direction so that the desired voltage marked on the switch is positioned at the drilled mark of the base. See the figures below.
Damage of equipment because of missetting of voltage selector is not within the limit of DENON liability.

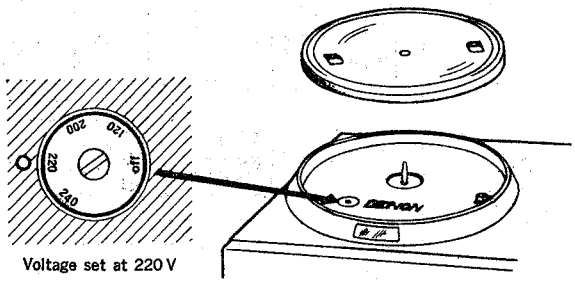

Fig. 4 Voltage Selector Switch

Set the voltage selector in accordance with the nominal power supply voltage as shown in the table.

ACTUAL (nominal) VOLTAGE (volt)	VOLTAGE SETTING
110 115 120	120
200	200
210 220	220
230 240	240

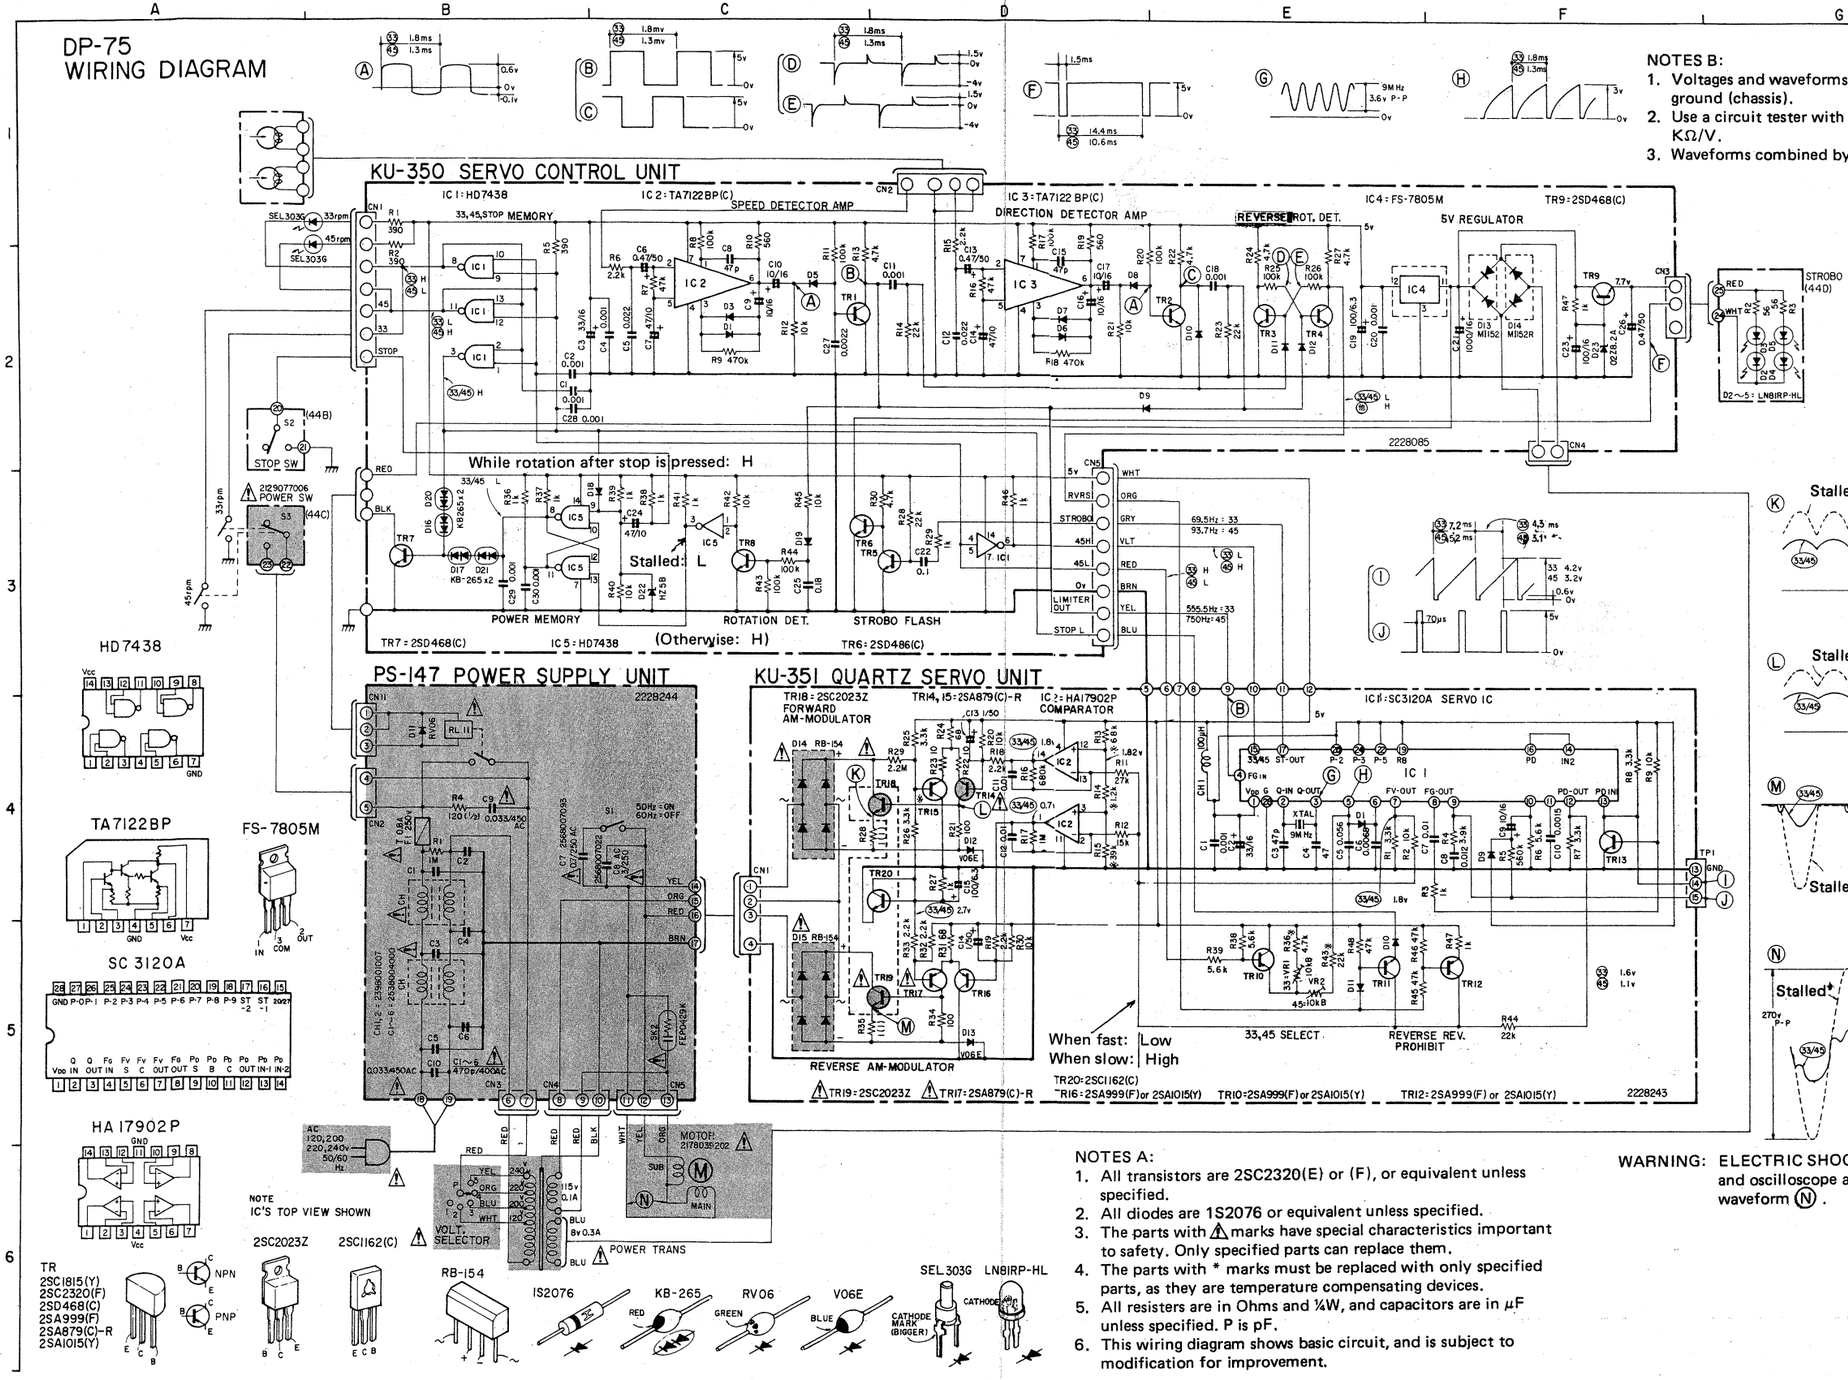
WIRING DIAGRAM



NOTES B:
1. Voltages and waveforms, except (N) are measured against ground (chassis).
2. Use a circuit tester with input impedance of more than 100 KΩ/V.
3. Waveforms combined by brackets have same time axis.

NOTES A:
1. All transistors are 2SC2320(E) or (F), or equivalent unless specified.
2. All diodes are 1S2076 or equivalent unless specified.
3. The parts with ⚠ marks have special characteristics important to safety. Only specified parts can replace them.
4. The parts with * marks must be replaced with only specified parts, as they are temperature compensating devices.
5. All resisters are in Ohms and ¼W, and capacitors are in μF unless specified. P is pF.
6. This wiring diagram shows basic circuit, and is subject to modification for improvement.
